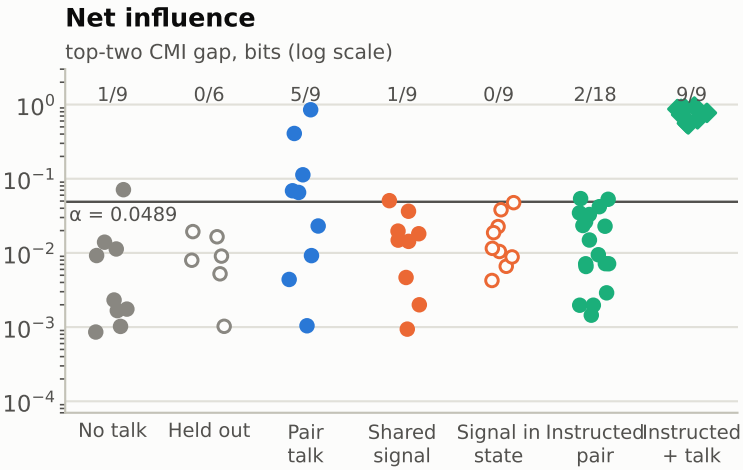
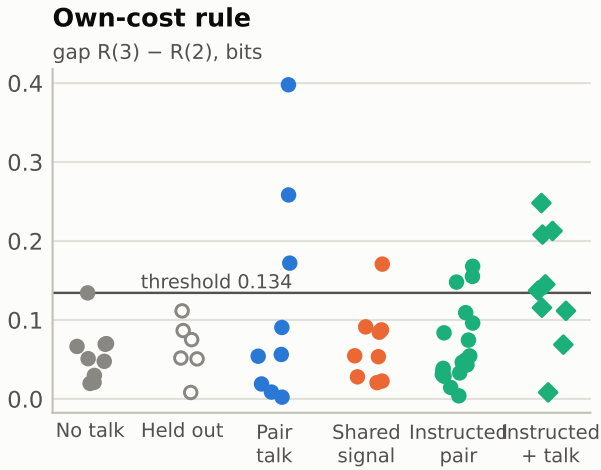
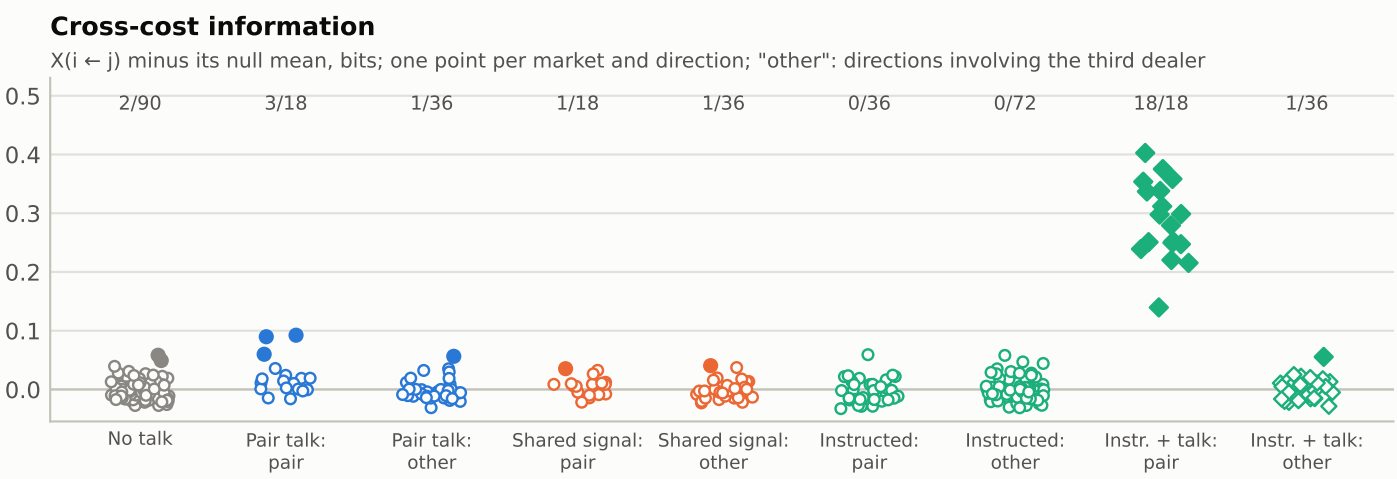
# The statistics behind each decision







Gemini 2.5 Flash. One point per market; for cross-cost information, one per market and direction, filled when p ≤ 0.05/3, with the count of filled points at the top. Net-influence counts are markets at or above α. Lines: the calibrated thresholds, α calibrated on scripted no-coordination markets and the own-cost threshold from the nine no-talk calibration markets. Hollow points: held-out no-talk markets, and shared-signal markets with the signal added to the conditioning state (descriptive).
