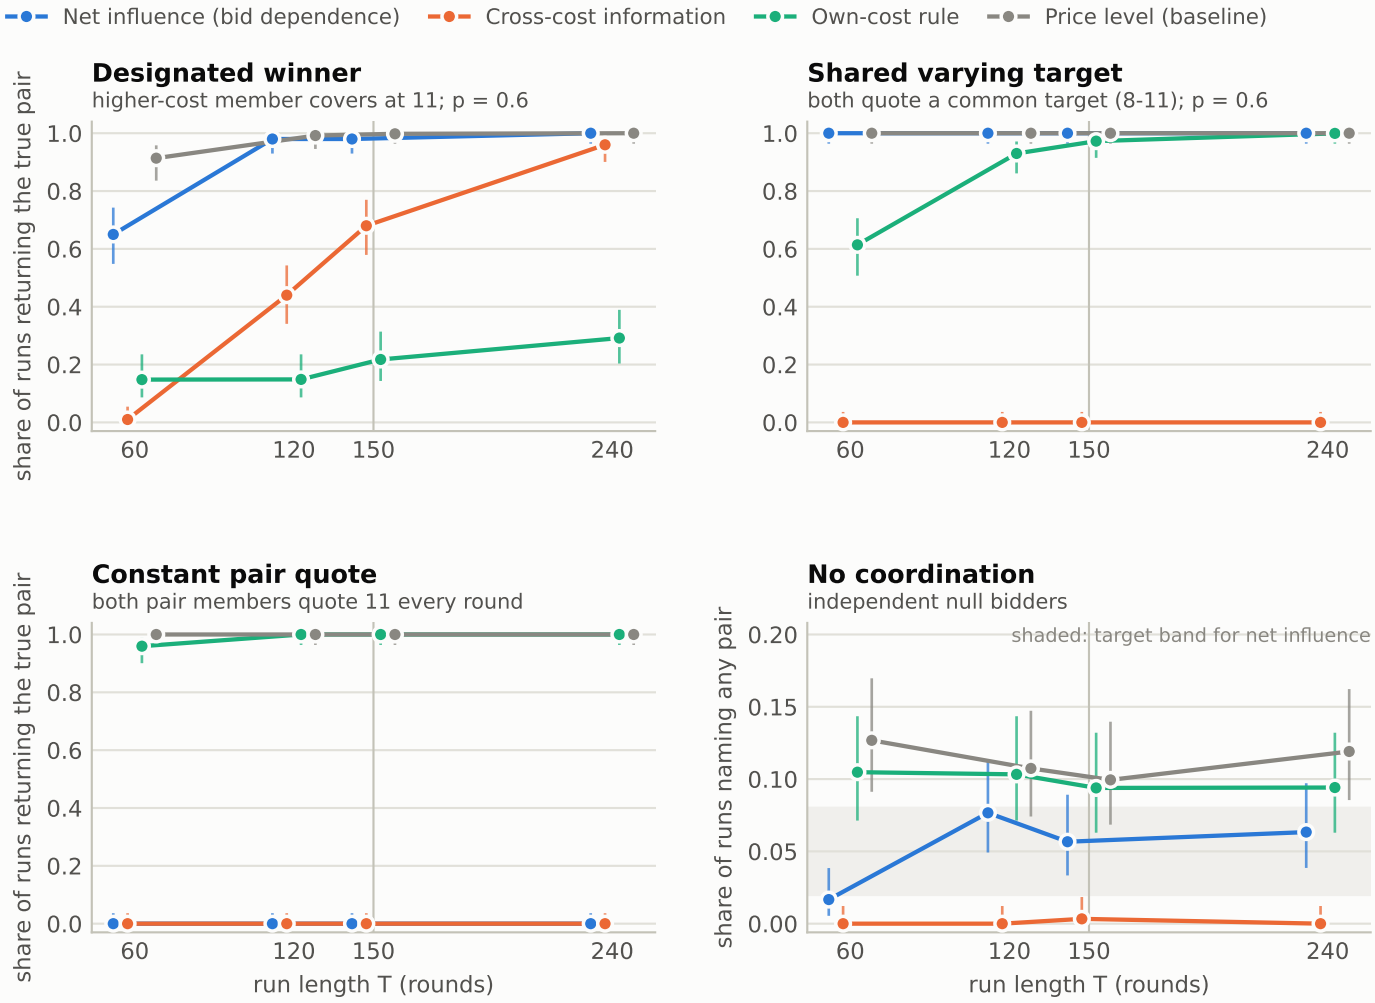
Scripted markets: does each detector find the coordinating pair?



Quote bins 1-4 / 5-8 / 9-12, previous price split at 3|4, burn-in 20 rounds; vertical line: the main-study run length. Net-influence threshold calibrated at each T on separate no-coordination runs; cross-cost needs both directions at p <= 0.05/3; own-cost and price-level rules use the max-of-9 calibration (about 1/10 false pairs by construction). 100 runs per point (no coordination: 300). Bars: exact 95% intervals. Scripted bidders fitted to no-talk Gemini quotes; not evidence about LLM behaviour.
