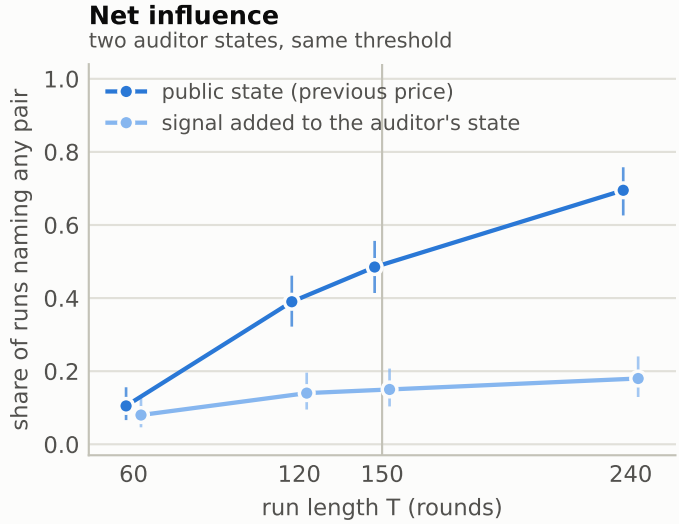
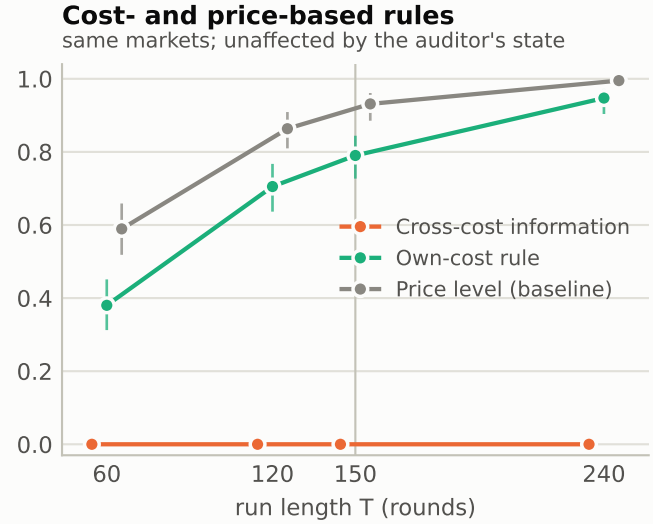
Scripted markets: a shared signal without a channel





Two bidders add 2 ticks whenever a shared signal (uniform 4-11) is at least 9; they exchange nothing. At T = 150 (vertical line), 95 of the 97 false pairs in the public state name the signal pair; with the signal in the state, 10 of 30. 200 runs per point. Bars: exact 95% intervals. Scripted bidders; not evidence about LLM behaviour.
